Kiriko – Briquetting Machine

- ✓ Renewable source of energy
- ✓ Quality chip compacting briquette machine
- ✓ So simple and easy to use!
- ✓ It helps to improve safety

Automatic Shavings Compactor

The Kiriko Automatic Shavings Compactor uses hydraulic power to compress metal shavings and chips, created by machines when cutting metal, into briquettes. The scraps and shavings are reduced up to 1/40th of their volume once compressed. This volume reduction ability allows you to save space when storing the shavings/chips and significantly reduces the frequency of transportation of collected shavings/chips as a higher volume can be transported at once when in briquette form.

Using the Kiriko contributes towards cost reduction and environmental protection. It removes cutting oil from the briquettes and stores it in a separate tank, enabling the recovery and reuse of the oil, saving you money on oil costs. The briquettes also fetch a higher price when scrapped than loose chips will, allowing you to make more money when recycling your scrap metal. If you melt down your scrap metal to reuse, the compacted briquettes give a higher yield during melting in the furnace. Kiriko even contributes towards achieving environmental management and improvement as required by ISO 14001 by significantly reducing CO2 emissions.
